

The "I" in the DIR® Model: Individual Differences

Published online October 1, 2015

Summary: Determining our children's sensory profiles will help us to identify how we can support our children's regulation, shared attention, engagement, and to emotionally interact with us

- ✓ We are born with an underdeveloped sensory processing system so our experiences can help wire our brains to our environment
- ✓ Our senses influence how we interact with our environment
- ✓ Every child wants to interact but some might find it too challenging
- ✓ We need to tailor our interactions with our children based on their individual differences in sensory processing
 - *Example: If they are sensitive to loud noises, we need to speak softly, not loud*
- ✓ A daily sensory diet can help our children maintain regulation so they are available to engage and interact with us
- ✓ The DIR method looks at behaviour as communication, aiming to determine the underlying causes of behaviour

DIR® and DIR/Floortime® are Registered Trademarks of ICDL, Inc.
